

## *BRCA 1, BRCA 2*

Hereditary predisposition to breast and/or ovarian cancer (HBOC)

The test involves analysing the *BRCA 1* and *BRCA 2* genes by two different molecular genetic techniques: NGS (Next-Generation Sequencing) and MLPA (Multiplex Ligation -dependent Probe Amplification), with a high mutation detection rate.

The test is certified CE-IVD, has been validated in our laboratory, and is subject to annual external quality assessment with the EMQN.

CE IVD
