

neoBona[®]

The new generation of
non-invasive prenatal
screening test

neoBona detects the most frequent chromosomal abnormalities that occur during pregnancy, by studying the cell-free fetal DNA present in maternal blood.

The test uses the innovative paired-end NGS (Next-Generation Sequencing) technology, for the highest accuracy.

It is available from 10 weeks of pregnancy, can be performed in cases of IVF after egg donation, and is suitable for twin pregnancies.
